13         Scanner in = new Scanner(System.in); // Creating scanner
14         object
15
16         // 1D Array Declaration
17
18         // Syntax A: Definition with size (Empty)
19         int[] arr = new int[5]; // Creates a box of 5 slots. All are 0
20         by default.
21
22         // Syntax B: Definition with values (Populated)
23         int[] nums = {1, 2, 3, 4}; // Creates size 4 and fills it
24         immediately.
25
26         /*
27         FAANG Note: In an interview, if you know data beforehand,
28         always use Syntax B.
29         It is cleaner and faster to write.
30         */
31
32         //      == PHASE 2: Iteration (Looping) ==
33
34         // 1. The Standard for Loop
35         for (int i = 0; i < arr.length; i++) {
36             arr[i] = in.nextInt(); // We need 'i' to tell the computer
37             WHERE to put the data
38         }
39
40         // 2. The Enhanced for Loop (For-Each)
41         for (int num: arr) {
42             System.out.print(num + " ");
43         }
44
45         System.out.println();
46
47         System.out.println(Arrays.toString(arr));
48

```

```

49      //      == PHASE 4: 2D Arrays (Matrices) ==
50
51      // Syntax
52      int[][] arr2D = new int[3][3]; // 3 rows, 3 columns
53
54      // Input Logic
55      for (int row = 0; row < arr2D.length; row++) {
56          for (int col = 0; col < arr2D.length; col++) {
57              arr2D[row][col] = in.nextInt();
58          }
59      }
60
61
62      //      == PHASE 5: Jagged Arrays ==
63
64      // Syntax
65      int[][] arrJagged = {
66          {1, 2, 4, 4},
67          {5, 6,},
68          {7, 8, 9}
69      };
70
71      // Dynamic Initialisation: Define rows later
72      String[][] arrDynamic = new String[3][]; // Define rows only
73      arrDynamic[0] = new String[4]; // Make row 0 size 4
74      arrDynamic[1] = new String[2]; // Make row 1 size 2
75      arrDynamic[3] = new String[3]; // Make row 2 size 3
76
77      /*
78      FAANG note: This is used in optimisation. If you are storing
79      comments on a post, one post might have
80      1,000 comments and another might have 0. A jagged array saves
81      memory compared to a fixed square matrix.
82      */
83
84
85      //      == PHASE 6: ArrayList (Dynamic Arrays) ==
86
87      // Syntax: Note: You cannot use primitives (int) here. You
88      must use Wrapper Classes (Integer).
89      ArrayList<Integer> list = new ArrayList<>(5);
90      list.add(23); // Adds to the end
91      list.add(45);
92
93      // Continuous Input: A common pattern to read input the input
94      stops
95      while (in.hasNextInt()) {
96          list.add(in.nextInt());
97      }

```

```

98
99
100      //      == PHASE 7: Multidimensional ArrayList ==
101
102      // Syntax
103      ArrayList<ArrayList<Integer>> multiAl = new ArrayList<>();
104
105      // Initialisation (Crucial Step): Unlike a 2D array, you
cannot just say list.get(0).add(1).
106      // You must initialise the inner lists first!
107      for (int i = 0; i < 3; i++) { // Create the empty lists
inside the main list
108          multiAl.add(new ArrayList<>());
109      }
110
111      // Now you can add data
112      multiAl.get(0).add(10); // Go to list 0, add 10
113
114      /*
115      FAANG Note: This Structure is exactly how Adjacency Lists are
built. An Adjacency List is the
116      primary way we represent Graphs (like connections in LinkedIn
or Facebook). You will use this
117      structure constantly in advanced interviews.
118      */
119
120  }
